XPi

- Models from 12 to 130 cc/rev
- 380 bar continuous working pressure
- 420 bar peak pressure
- Automatic adjustment to desired direction of rotation
- For use on DIN-mount PTO

XPi series

XAi - SAE

- Models from 18 to 63 cc/rev
- SAE version of XPi bent axis piston pumps
- 380 bar continuous working pressure
- 420 bar peak pressure
- Automatic adjustment to desired direction of rotation
- For use on SAE-mount PTO

XAi - SAE series

PA - PAC

- Single flow models from 25 to 114 cc/rev
- Twin flow models from 2x25 to 2x75 cc/rev
- Model with two different displacements
- 400 bar continuous working pressure
- 500 bar peak pressure
- Dual direction of rotation
- For use on DIN-mount PTO

PA - PAC series

TXV

- Variable displacement pumps with Load-Sensing control
- Displacement from 40 to 150 cc/rev
- Maximum operating pressure up to 420 bar depending on model
- For use on DIN-mount PTO

TXVA - SAE

- For use on SAE-mount PTO
- Models available : 75 and 92 cc/rev

TXV with Constant Torque

- Models from 40 to 150 cc/rev
- TXV130 with constant torque control - with through shaft version

TXV series

XPi series

the *intelligent* pump

fixed displacement bent axis design

The compact size envelope of XPi pumps, together with their technology, means they can be installed in environments with little space available, and be used at relatively high rotating speeds.

ADVANTAGES

- ▶ Pump automatically sets to required direction of rotation
- ▶ Mounting and start-up, easier than ever !

CHARACTERISTICS

- 7 pistons
- Innovative plate - barrel synchronisation
- use of materials with high mechanical resistance
- reinforced sealing

■ 10 models :

- from 12 to 130 cc/rev
- 380 bar continuous working pressure
- 420 bar peak pressure
- max. speed from 1750 to 3150 rpm

(1) At absolute pressure 1 bar, ISO VG46 fluid at 25°C.

(2) Maximum torque given with a mechanical efficiency at 95%.

DUAL DIRECTION OF ROTATION:
this *intelligent* pump can operate in either direction of rotation.

Fit the inlet fitting on required side, depending on the direction of rotation of the PTO, and the pump will set itself accordingly.

When the PTO turns counter-clockwise, the pump has to turn clockwise.

When the PTO turns clockwise, the pump has to turn counter-clockwise.

DEFLECTOR TO PROTECT SHAFT SEALS

This deflector ensures the protection of the pump shaft seals.

In particular, it protects the pump from projections of dirt from the road in cardan drive installations.

BY-PASS VALVE FOR XPi PUMPS

For XPi pump applications where the pump is driven by a continuous running PTO (PTO which cannot be disengaged), this solution allows the continuous running of the pump:

- without creating problems of fluid overheating;
- without affecting pump service life;
- with no modifications necessary to the hydraulic circuit of the equipment.

⇒ **By-pass fitted on the back of the XPi pump.**

LEDUC references	24 Volts
XPi 12 to XPi 63	BP63 0517931
XPi 80 to XPi 130	BP80 0522140

► How does it work ?

The by-pass valve is a 24 Volts solenoid valve.

When not activated, it enables pump output to link up to pump inlet.

When it is activated, the pump operates normally (output flow).

A drain line has to be installed between the By-Pass valve and the hydraulic tank of the vehicle to ensure sufficient oil circulation and a good cooling into the pump. In any case, the connection to the tank must be done below the oil level.

XAi series

the *intelligent* pump - SAE version

fixed displacement bent axis design

The compact size envelope of XAi pumps, together with their technology, means they can be installed in environments with little space available, and be used at relatively high rotating speeds.

ADVANTAGES

- ▶ Pump automatically sets to required direction of rotation
- ▶ Mounting and start-up, easier than ever !

CHARACTERISTICS

- 7 pistons
- original idea for plate - barrel synchronisation
- use of materials with high mechanical resistance
- reinforced sealing

■ 10 models :

- from 18 to 63 cc/rev (1.1 to 3.84 cu.in/rev)
- 380 bar (5511 psi) continuous working pressure
- 420 bar (6092 psi) peak pressure
- maximum speed from 2300 to 2650 rpm

BY-PASS VALVE FOR XAi PUMPS

For XAi pump applications where the pump is driven by a continuous running PTO (PTO which cannot be disengaged), this solution allows the continuous running of the pump:

- without creating problems of fluid overheating;
- without affecting pump service life;
- with no modifications necessary to the hydraulic circuit of the equipment.

⇒ **By-pass fitted on the back of the XAi pump.**

Reference	24 Volts	12 Volts
XAi 18 to XAi 63	BPA63 0521715	BPA63 0518520

► How does it work ?

The by-pass valve is a solenoid valve (12 or 24 Volts).

When not activated, it enables pump output to link up to pump inlet.

When it is activated, the pump operates normally (output flow).

A drain line has to be installed between the By-Pass valve and the hydraulic tank of the vehicle to ensure sufficient oil circulation and a good cooling into the pump. In any case, the connection to the tank must be done below the oil level.

PA | PAC series

piston pumps

fixed displacement in-line design

ADVANTAGES

- ▶ Of unique design, the PA and PAC pumps offer a robust solution with **long service life** for high pressure requirements in truck hydraulics.
- ▶ Relatively insensitive to contamination, these pumps are particularly **well suited to the harshest environments**.
- ▶ The design means the pumps can rotate either clockwise or counter-clockwise **without any user intervention**.
- ▶ Like all truck pumps designed by HYDRO LEDUC, this range is fitted with the **latest innovation in terms of sealing**:
 - Front of pump fitted with two shaft seals: externally, a seal capable of resisting the high temperatures of the gearbox, and internally, a seal adapted to the hydraulic requirements.
 - A transparent flexible tube fitted between the two seals, to protect these seals from dirt from the road, and from high pressure water jet during washing of vehicle etc...

The PA, PAC pump series comprises two ranges, all designed for truck applications at working pressures up to 5800 psi (400 bar) continuous and 7252 psi (500 bar) peak.

► PA pumps

- single flow from 25 to 114 cc/rev
- twin-flow from 2x50 to 2x75 cc/rev
- two different flows: 75-40 cc/rev

► PAC pumps

Series offering the most compact size envelope :

- single flow from 40 to 80 cc/rev
- twin-flow from 2x25 to 2x40 cc/rev

► Volumetric efficiency

TXV series

pumps with

Load Sensing control

variable displacement piston pumps

ADVANTAGES

- ▶ TXV series pumps are variable displacement with pressure-flow control – called **Load Sensing**. They **self-regulate to give just the flow required for each movement**.
- ▶ Specifically designed for the needs of the *truck hydraulics market*, TXV pumps are particularly well adapted for applications in:
 - loader cranes,
 - forestry cranes,
 - refuse vehicles,
 - salt spreaders, snow and ice equipment,
 - construction equipment vehicles.
- ▶ Extremely compact in size to allow direct flange-mounting on vehicle engine or gearbox PTOs.
- ▶ TXV pumps are available in 11 models with maximum displacement from 40 to 150 cc/rev.

Maximum pressure is up to 420 bar depending on model.

Why use a variable displacement pump?

- ▶ Installing a TXV variable displacement pump will transform your hydraulic equipment. Slow or rapid movements are done with precision, due to the constant adjustment of pump flow rate.
- ▶ The pump incorporates a load sensing device to control flow and maximum pressure. This control device is piloted by a proportional valve which informs the pump of the flow needed for the different circuits supplied by the pump, independently of pressure.

1 & 3

For slow and precise movements, the pump adjusts its flow to whatever the user needs, whilst also controlling maximum circuit pressure. Oil heating and lamination, and noise level, are considerably reduced compared to a fixed displacement pump.

The motor driving the pump only provides the power actually needed by the equipment, thus ensuring:

- longer service life of that equipment;
- significant gains in energy consumption;
- and overall a more environmentally friendly solution.

2

For rapid movements, the pump supplies the required flow virtually instantaneously.

The proportional movement of the control lever is perfectly reproduced by the pump.

TXV - How does it work ?

- ▶ TXV variable displacement pumps are of axial piston design with 11 pistons, thus ensuring optimal regularity of flow and a low noise level.
- ▶ The displacement of the pump is proportional to the stroke of the pistons. Displacement – and thus flow - is varied by changing the angle α of the swashplate (Fig. 1).
- ▶ To change displacement from maximum to zero (complete flow cancellation), the swashplate angle goes from α max (Fig. 1) to α min (=0) (Fig. 2).

Figure 1 - Maximum displacement

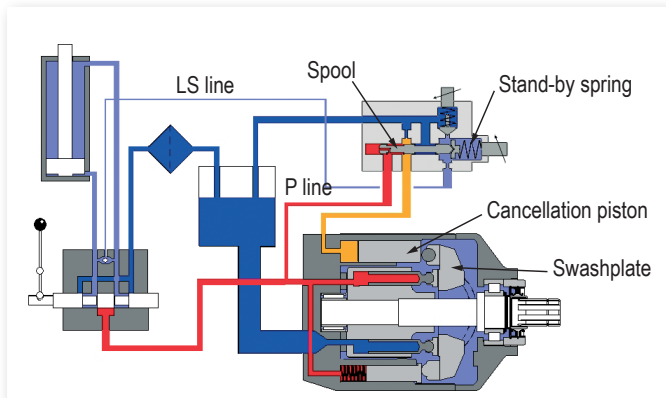

Figure 2 - zero displacement

- ▶ Setting the servo pump.

► Zero flow (standby)

The proportional valve is closed.

The pressure in the P line increases until it reaches the value at which the stand-by spring is set.

Under the pressure in the P line, the spool moves and oil flow supplies the setting piston which moves the swashplate into vertical position (angle $\alpha = 0$): no flow, but standby pressure is maintained. The pump stays in standby mode.

► Full flow

The proportional valve is fully open, allowing passage of pump flow.

The pressure in the LS line is the same as in the P line.

Hydraulic pressure is the same on either side of the spool.

The stand-by spring holds the spool in its closed position.

The cancellation piston is not supplied with oil.

The swashplate is at maximum angle α : the pump is at full displacement.

► Flow control

As soon as the proportional valve tends to reduce the flow requested by the user, the pressure drop created allows the pump displacement setting piston to be piloted.

This setting piston automatically adjusts pump displacement to match the order given by the proportional valve.

► Zero flow (maximum pressure)

This is the case for example of a cylinder which arrives at a mechanical stop. The proportional valve is still open.

The pressure of the cylinder at a mechanical stop is sensed by the pump pressure relief valve which opens at the set pressure (PC).

This allows the pump displacement setting piston to be supplied and the pump sets itself to a displacement just sufficient to maintain the circuit pressure.

TXV pumps are available in 11 models from 40 to 150 cc/rev maximum displacement.

TXV 130 THROUGH SHAFT PUMP

The TXV 130 pump exists in a "through shaft" version.

With side porting for inlet and output, this "through shaft" TXV 130 configuration means any LEDUC TXV pump, or fixed displacement XPI or PA pump, can be mounted on the back.

The maximum displacement of the "through shaft" TXV 130 can be factory set, on request, between 60 and 110 cc/rev on request.

It is important to check that maximum torque to be transmitted by the shaft of the "through shaft" TXV 130 does not exceed 900 N.m.

A closing plate must be used when using the pump alone (see page 37).

Dimensions in mm.

TXV 130 THROUGH SHAFT PUMP

View from F (see p.30)

► Support device

The support device for the pump must be fixed to the same part which the pump is mounted on (see diagram below) and has to be designed to avoid strain on the pump flange.

**Maximum torque transferable by the shaft
of the pump driven by the PTO:**

$$C = 900 \text{ N.m}$$

That is, the sum of torque for both pumps must be < 900 N.m.

Please consult our Technical Department for advice regarding your installations.

			Outlet : G 3/4"		
7	Control types		Constant Pressure		PC
			Flow-Pressure Regulator		LS
			Closure Plate		PF

PC | Constant Pressure

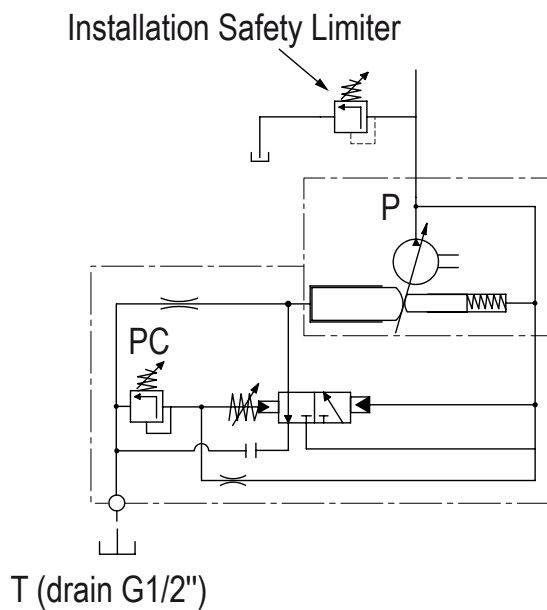

The constant pressure regulator maintains the pressure within a hydraulic receiver. As soon as the set pressure is reached, the pump's flow adjusts automatically to match the receiver's consumption. This arrangement prevents overheating and power consumption for all pressure maintenance applications.

Examples:

- Hydraulic press
- Compression molds
- Manufacturing of bonded composites

IMPORTANT:

Without further specifications in the order:
PC set at 100 bar.

LS | Flow-Pressure Regulator

► Control of Q and P (LS: "Load-Sensing")

This regulation (LS) allows continuous control of the flow and maximum discharge pressure of the pump. With this arrangement, it is easy to envision all possible combinations:

- High flow and low pressure,
- High pressure and low flow.

IMPORTANT:

Without further specifications in the order:
PC set at 100 bar, Stand-by at 30 bar.

ADVANTAGES OF THE CONSTANT TORQUE REGULATION

- ▶ TXV pumps with constant torque control which ensures regulation to maintain Pressure X Flow = Constant
- ▶ Control device available for the entire range of TXV pumps from 40 to 150 cc/rev., including the TXV130 model with through shaft
- ▶ Maximum torque between 90 and 700 Nm depending on models
- ▶ Torque/power adjustment screw

► Technical characteristics

- It protects the LS regulator against contamination coming from the circuit.
- Filter can be removed for maintenance.
- Filtration: 150 microns.

► Drawings for both versions of the kit (dimensions in mm):

SEAL + FILTER | LEDUC CODE K000028

The LS filter protects the TXV's Load Sensing valve against contaminations coming from the hydraulic circuit.

Mounted as standard on all TXV pumps.

KIT CLOSING PLATE + SEAL | LEDUC CODE P001512

FOR TXV 130 THROUGH SHAFT

CARDAN PLATE - DIN 90 and DIN 100

The cardan plate enables the pump shaft to be connected to a cardan shaft with interface as on drawing on the right.

Note: the maximum admissible torque is limited by the drive shaft.

The deflector is supplied with the cardan plate.

Type	LEDUC code	ØA	ØB	C	D	E	F	ØG	H
DIN 90	056315	90	47	43	2	10	62	55	15
DIN 100	0519040	100	57	43	2	10	64	55	15

FCV - FLUID VALVE CIRCULATION | LEDUC CODE: 0524940

The fluid circulation (FCV) is designed for applications where the hydraulic variable displacement pump is used in standby mode for a long period of time, for example engine PTO, to protect the pump against overheating.

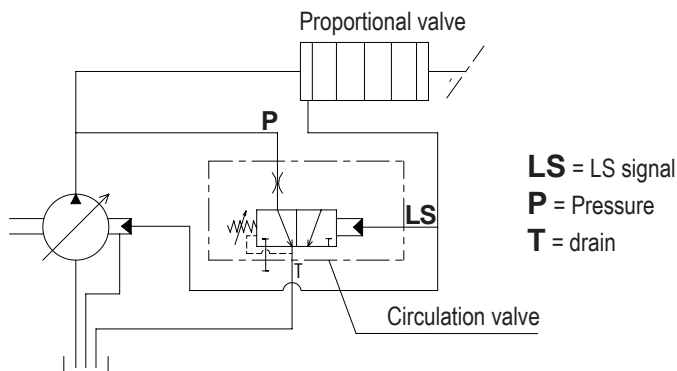

► Technical characteristics

- The valve flow varies between 20 and 22 l/min for a ΔP at 30 bar.
- Maximum pressure is 420 bar.
- The closing pressure is 2 bar min. and 7 bar max.

► Dimensions

► Schematics

► Setting of the control pressure

MAXIMUM DISPLACEMENT SETTING SCREW

The TXV pumps from 40 to 150 cc/rev are made as standard to be able to use a setting screw:

- Reference : **0518386** for TXV 40 to 120 pumps
- Reference : **0523899** for the TXV 130* and TXV 150*

**Except TXV through shaft and constant torque.*

The pump displacement can thus be adjusted to exactly what is needed.

► How to set maximum displacement

Unscrew **1** completely, loosen nut **3** and screw **2** to obtain dimension **X** on graph below, and the corresponding displacement (see figure).

- For TXV 150 : 1 turn of the screw changes the displacement by 7.5 cc.
- For TXV 130 : 1 turn of the screw changes the displacement by 6.5 cc.
- For TXV 120: 1 turn of the screw changes the displacement by 9 cc.
- For TXV 92 to TXV 40: 1 turn of the screw changes the displacement by 8 cc.

TXV 40-120

TXV 130-150

SETTING OF THE REGULATION

► Stand-by

TXV pumps are supplied as standard with standby pressure set at 30 bar.
On request, this standby pressure can be set between 25 and 60 bar.

► Maximum pressure

Cancellation pressure PC of the pump must be the same as the maximum working pressure of your installation. This PC pressure should be specified in the order. If no PC setting is specified, pumps will be supplied with PC set at 100 bar.

► Relief valve in the entry plate of proportional valve

Must be set 25 to 30 bar higher than the chosen PC pressure.

► Response time

Response time of TXV pumps, from zero flow up to full flow, can be adapted.

For further information or advice, please contact our Customer Service Department.

OPTIMIZE THE **SERVICE LIFE** OF YOUR **LEDUC PUMP**

► Tank

Generally, hydraulic pumps perform better when the tank is above the pump. LEDUC pumps can also operate with oil level beneath the pump.

For further information on such installations, please contact our Technical Department.

Correct inlet conditions are between 0.8 to 2 bar absolute pressure.

The tank should preferably have a separation between inlet side and return. This avoids fluid emulsion and the introduction of air into the hydraulic circuit.

Ensure also that the suction is not from the very bottom of the tank, so as to protect the pump from any deposits (particles).

► Hosing

The supply line should be dimensioned to ensure fluid speed between 0.5 and 0.8 m/second.

Choose as direct a supply line as possible, avoiding sharp bends.

► Filtration

The service life of the pumps is highly dependent on the quality of the hydraulic fluid and level of cleanliness.

We recommend the following minimum cleanliness:

- Cleanliness class 9 according to NAS1638;
- Cleanliness class 6 according to SAE;
- Cleanliness class 20/18/15 according to ISO/DIS 4406.

We recommend using of a return filter of 20 µm absolute maximum.

► Drain pressure

It is essential to drain the pump, to avoid excessive pressures on the shaft seal. Maximum acceptable internal pressure depends on pump rotating speed.

Ensure that the working pressure in the housing does not exceed 2 bar, whatever the pump rotation speed and the viscosity of the fluid. Other operating may be possible; please consult our Technical Department.

► Preparation of the pump

Before start-up, the pumps should be filled with clean hydraulic oil. (minimum 50%).

► Fluid

Use a mineral hydraulic oil type HLVP according to DIN 51502 (or HV according to ISO 11158) with viscosity between 10 and 400 cSt. It is in this viscosity range that the pump keeps its volumetric characteristics.

The optimal viscosity range is between 20 and 30 cSt. A maximum viscosity of 1000 cSt is accepted when starting up at low speed and without pressure.

If you wish to use other fluids, please consult our Customer Service Department.

Maximum temperature of fluid in the pump should not exceed 80°C.

► Drive and assembly recommendations

If cardan shaft drive: check the quality and correct installation of the cardan shaft.

For PTO mount applications, be careful to respect the tightening recommendations in terms of pump onto PTO and PTO onto vehicle gearbox. (according to the PTO manufacturer's specifications). If the mounting on the PTO is not lubricated, grease the splines with graphite grease (example Molycote G rapide).

LEDUC pumps are not designed to withstand any axial or radial load on the pump shaft. Check your installation conforms to this requirement.

► Elastic support device

For pumps with a greater overhang torque than that accepted by the PTO, it is recommended to use an elastic support device to support the weight of the pump. This support has to be designed to avoid strain on the pump flange.

We do not sell the elastic support.

It must be suitable for the environment of the pump assembly.

► Start-up

- Open the supply valve if there is one.
- Check the valve is in "back to tank" position.
- Start up at low speed, or by successive starts/stops.
- Let the pump run for one to two minutes, and check that the flow is regular.
- Check the pump is running correctly, with neither vibrations nor a normal noise.
- After several hours of operation, check the tightening torque of the pump on the PTO according to the PTO manufacturer's specifications.

► Maintenance

Some regular checks are necessary, namely:

- tightening of pump to PTO;
- cleanliness of fluid;
- state of filter.

LEDUC pumps designed for truck hydraulics are all fitted with reinforced sealing comprising:

► **two radial seals :**

- an outer seal adapted to the needs of PTOs and gearboxes;
- an inner seal adapted to the hydraulic requirement.

► **an original protection of the pump shaft seals :**

This is a flexible transparent tube which avoids any entry of contaminants between the two seals, and guarantees high pressure water jet cleaning of vehicle will not damage the sealing area. It also allows air vent of the chamber between the two seals.

WARNING : if you notice any trace of oil in the tube, the tightness of PTO-pump should be checked immediately.

RECOMMENDATIONS FOR ATTACHING THE PROTECTIVE TUBE

✓ Make a siphon with the tube so as to avoid any introduction of dirt from road, and water or damp from high pressure washing of vehicle.

✓ Put the end of the tube downwards, or in a place sheltered from any projections.

✓ Fix the tube in place using a collar/clip.

✗ Avoid attaching the tube to any parts which may move, this could lead to it being damaged or torn off.

✗ Avoid any pinching or folds in the tube when fixing it in place.

✗ Make sure the end of the tube is not blocked.

INFORMATION

HYDRO LEDUC stresses that on non-sealed PTO installations it is the hydraulic pump which ensures the sealing of the vehicle gearbox.

This is why HYDRO LEDUC offers tried and tested solutions approved by vehicle manufacturers.

Note in particular the pump - PTO sealing has to be done via the seal C002510 supplied with the pump.

Example of tube attachment

PISTON PUMPS FOR TRUCKS

HYDRO LEDUC offers 3 ranges of piston pumps perfectly suited for truck applications, mountable on power take-off.

- Fixed displacement from 12 to 130 cm³/rev
- Fixed displacement, dual flow, from 2x25 to 2x75 cm³/rev
- Variable displacement, with LS (load sensing) control, from 40 to 150 cm³/rev.

PUMPS FOR MOBILE & INDUSTRIAL APPLICATIONS

The W series consists of fixed displacement pumps, and the TXVA series consists of variable displacement pumps. These pumps are capable of operating at high pressures while occupying minimal space.

► W Series (ISO) and WA Series (SAE)*

- Fixed displacements from 5 to 180 cm³/rev
- Flanges according to ISO 3019/2 or SAE standards
- Shafts according to DIN or SAE standards

► TXVA Series

- Variable displacements up to 92 cm³/rev
- SAE shafts and flanges

* For the SAE version, please contact our Customer Service.

HYDRAULIC MOTORS

Axial Piston Motors with Constant and Variable Displacement

- Models from 5 to 180 cc/rev
- DIN and SAE Versions
- Constant Displacement, Motors without Leak Oil Connection Special Version.

Complete catalog: www.hydroleduc.com

HYDROPNEUMATIC ACCUMULATORS

Diaphragm, Bladder, Bladder-Diaphragm, and Piston Accumulators in spherical and cylindrical designs.

- Storage capacities from 0.02 to 50 liters
- Operating pressures up to 400 bar
- Accessories for operating hydraulic pressure accumulators.

MICROHYDRAULIC

A specific field of application for Hydro Leduc's expertise.

- Axial and radial piston pumps with constant and variable displacement.
- Axial piston micro-hydraulic motors.
- Micro-hydraulic components (electric drives, valves, control devices, etc).
- HYDRO LEDUC offers a comprehensive range of reliable solutions for extreme applications and compact spaces.

Our development team takes care of your individual requirements.

In close collaboration with the decision-makers in your organization, we work together with you to develop solutions according to your specifications.
